About Rolling With Over-Reduction

yond a certain limit will even aggravate these phenomena. The reserve of frictional forces in shaping mills appears to be slightly lower than in theory. Soft steel strips are nipped fairly easily at  $\alpha = 19-22^{\circ}$ , but soon after the grip they tug and skid interfering with the rhythm of the operation. The increase in the rate of reduction is suggested mainly for blooming mills by several research workers. However, for this kind of mills the limits set for the bits do not correspond to the normal operation of the electric motor. The best way of increasing the output of shaping mills, was found in the Magnitogorsk Metallurgical Combine, is the differentiation of the dimensions of products, by which the reductions could be considerably decreased on shaping mills. However, according to the author the output of the mills can be raised more efficiently by working with 10 or even with 12 stands operating in the conventional manner than by using 8 stands and apply grocves or other measures to increase the rate of reduction. In some cases it is justified to increase reduction, for instance, on old-type shape mills with three-roller roughing stands. On these mills an increased rate of reduction resulting in a smaller number of passes, to some extent increases productivity. Also on some types of continuous mills good results can be obtained

ORIG. PUB. : Folia Biol., 1956, Vol.2, Ro.3, 129-140

: In animals (rats and rabbits) in which suppression ABSTRACT of the formationof antibodies was achieved by dai-

ly injections, over a period of 5 months, of Salmonella paratyphi B., the protective reactions (leukocytic reaction, cytologic changes of the peritoneal exudate, fluctuations in titer) did not change. Inhibition of the formation of antibodies (IFA) depended on the immunologic sensitvity of the animal, the amount of antigen, and the site of injection of it. The author considers the IFA in prolonged immunization as an adaptive phenomenon, since increasing the dose of antigen removed

the IFA.

Title

Devices for Tuning Ultrashort-Wave Receivers

Periodical

Radio. 5, 57 - 61, May 1954

Abstract

The article describes several instruments used for regulating or tuning ultrashort-wave receiver units, and radio-outlet point adapters. The following equipment is described and the related circuit diagrams are shown: 1) a quartz oscillator for medium-frequency wave control; 2) an ultrashort-wave quartz oscillator; 3) a wide-band USW amplifier, and 4) a USW piezoelectric oscillator. The article also gives the description and the block diagram of the distribution network, indicating the position of points to be tested and tuned. Diagrams; tables.

TITLE:

A New Link Trainer

PERIODICAL: Grazhdanskaya aviatsiya, 1959, Nr 9, p 17 (USSR)

ABSTRACT:

The article contains a general description of a new link trainer for pilots of II-14 aircraft, which is being prepared for serial production. Its size and equipment are identical with those of actual aircraft. The trainer has a wide range of training capabilities and can simulate almost any situation likely to occur during a flight, including the landing approach by the OSP and SP-50 methods. The duplicate instruments on the instructor's control panel outside the trainer enable the instructor to have a group of students around, for them to watch the performance of the trainee and learn from it. The new trainer is said to work quite satisfactorily. There are 2 photographs.

TITLE: Flow with friction and heat transfer in a conical nozzle

Inzhenerno-fizicheskiy zhurnal, v. 6, no. 8, 1963, 41-44

TOPIC TAGS: conical nozzle, heat transfer, supersonic flow, stagnation temperature, stagnation pressure

ABSTRACT: An analysis of supersonic flow in a conical nozzle is made which takes into account both friction and heat transfer. The flow is assumed to be one-dimensional; i.e., the value of the tangent of the angle of inclination of the nozzle contour is small, and the stagnation-temperature recovery factor in the boundary layer is assumed to be unity. Equations of motion, continuity, and heat transfer are used as the basis for establishing formulas for calculating the flow parameters at any cross section, i.e., velocity, pressure, density, temperature, impulse, and stagnation-pressure recovery factor. Orig. art. has: 11 formulas.

184-186

Abstract

A method of "thick drop" is used; the staining method differs from the commonly accepted Ziehl-Neelsen method by the absence of discoloration with H<sub>2</sub>SO<sub>l1</sub> and use of an alcoholic, not aqueous, solution for additional coloration. From blood taken by syringe from the veins of 59 patients of the lepromatose type of leprosy, 226 "thick drops" were prepared; in 115 of

them (50.8%) leprosy bacilli were found.

Abstract

: In 40 patients with eczema, dynamic studies were carried out on the cold sensitivity of affected and clinically healthy skin (sensation of cold upon the application of wires of one mm diameter to the skin, with the wires at a temperature of zero degrees C). The ratio between the number of cold points in damaged and healthy skin variod widely. In the acute stages of eczema and during relapses, as a rule, the number of cold points in eczematous foci was reduced. In the process of dovelopment of

Experiments on the production of sulphur free benzene TITLE

PERIODICAL: Koks i khimiya, no.1, 1963, 41-43

In conjunction with the start of production of caprolactam on the Kemerovskiy khimicheskiy kombinat (Kemerovo Chemical Combine) the coking works were to develop the production of sulphur free benzene. On the basis of laboratory work, two batches of works' benzole containing 0.098-0.116% thiophene and 0.022-0.036% carbon disulphide were washed with 95% sulphuric acid (two washes), then with alkali and batch distilled. the initial benzole fraction was: sulphur free benzene 75.6%, nitration benzene 14.5%. Wash losses - 9%, distillation losses -Consumption of acid 287 kg/ton and of alkali 12.4/t of the benzole fraction. Laboratory tests on the purification of benzole from thiophene by its copolymerization with unsaturated compounds present in heavy benzole indicated that only low sulphur benzene can be obtained by this method. The removal of thiophene by Card 1/2

Experiments on the production of ... 5/068/63/000/001/001/004 b.071/E136

washing with sulphuric acid with addition of cyclohexene (by-product in the production of caprolactam) was tried on a laboratory scale with satisfactory results. Using 20% of sulphuric acid and 1.85% of cyclohexene, practically complete removal of thiophene was obtained after 10 minutes of stirring. It is considered that rectification is the most rational method of removal of carbon disulphide. There are 4 tables.

Author : Shteyn, B. B., Active Member, VNORiE

Title : Analysis and calculation of a wide-band phase-shifter circuit

Periodical: Radiotekhnika 9, 53-67, Mar/Apr, 1954

Abstract: Presents theoretical analysis and procedure for calculating a wide band RC phase shifter using 6Zh8 tubes. Shows the dependency of the constancy of phase difference between the output voltages on the phase shift angle and the given frequency range. This method of calculation permits the prompt determination of the degree of constancy of phase difference at given angles of phase shift and frequency range or the solution of the inverse problems. Derives formulas for calculating ciruit values. Thanks Professor B. P. Terent'yev, A. A. Shenogin, and V. D. Veynshteyn for assistance.
